

Pneumococcal Vaccine Fact Sheet

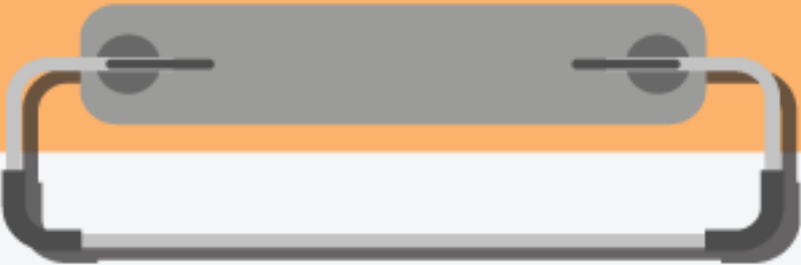

Ask a Pharmacist Office Hours

1. The pneumococcal vaccines, also known as Pneumovax-23, Prevnar, and pneumonia vaccine, is given to prevent an infection by the bacteria *Streptococcus pneumoniae*.¹
2. The idea that pneumococcal vaccines prevent pneumonia is confusing, as pneumonia is infectious inflammations of the lung's air sacs, which can be caused by many different bacteria and viruses.²
3. The SARS-CoV-2 virus can cause pneumonia itself or can predispose patients to develop pneumonia due to some other microbe.³ Interestingly, *S. pneumoniae* is generally not the cause of pneumonia that develops after COVID-19.⁴
4. Pneumococcal vaccines are important, however, and offer protection against a serious disease. The recommendations for dosing with these vaccines are complex, but generally speaking patients are eligible if they are older than 65 years.¹
5. Patients older than 65 years with unknown pneumococcal vaccination status are eligible to be vaccinated.⁵
6. Follow this link for the current pneumococcal vaccination recommendations: [Adult Immunization Schedule by Vaccine and Age Group | CDC](#). Pneumococcal is the 8th row from the top.
